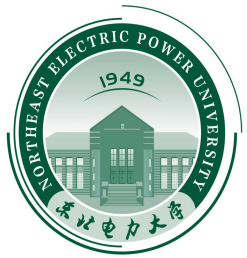
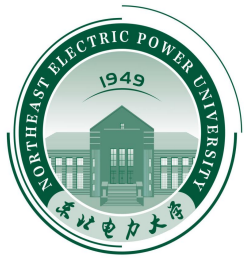
目录

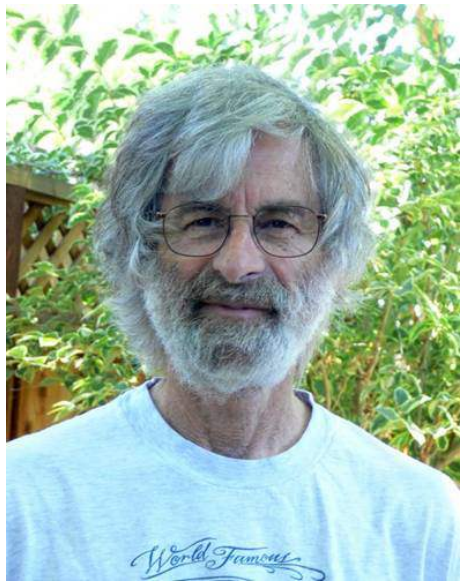


目录



TEX 与 LATEX

1. TEX (/'tɛk/,/'tɛx/)
   - 最初由 Donald E. Knuth 于 1978 年开发
   - 生成精美的图书排版系统
   - 漂亮、美观、稳定、通用
   - 尤其擅长数学公式的排版
   - 当前的版本号为 TEX3.14159265
2. LATEX (/'leitɛk/)
   - Leslie Lamport 开发 LATEX 降低使用门槛
   - 最流行和使用最为广泛的 TEX 宏集
   - 广泛用于学术界，期刊会议论文模板
   - 大学学位论文模板
   - CV、Poster



几个概念

套装发行版：是 TEX 排版引擎、支持排版的文件（基本格式、LATEX 宏包、字体等）以及一些辅助工具的集合。

- MikTEX、TEX Live、CTeX

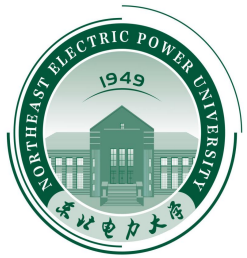
编译器：也称为排版引擎，是编译源代码并生成文档的程序。

- pdflatex、xelatex、lualatex

编辑器：用什么东西写代码

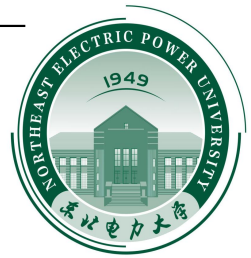
- TeXworks、TeXstudio，WinEdt、TeXshop、Notepad++

CTeX 套装发行版和 CTEX 宏包/文档类是两回事



和 word 对比

Microsoft®word	LaTeX
文字处理工具	专业排版软件
容易上手，简单直观	学习成本高
所见即所得	所见即所想，所想即所得
高级功能不易掌握	进阶难，但一般用不到
需要花费大量时间调格式	专心内容，无需关系格式
公式排版差强人意	尤其擅长公式排版
各版本兼容性差	易读，稳定
商业付费	自由免费



TEX 排版举例: 数学公式

无编号公式

$$f(x) = f(x^{(0)}) + f'(x^{(0)})\Delta + \frac{1}{2}f''(x^{(0)})(\Delta x)^2 + \cdots$$

有编号公式

$$f(x) = \begin{cases} \dfrac{\cos x}{x + \sin x} & x \geq 0 \\ ax^2 + bx + c & x \leq 0 \end{cases} \tag{1}$$

$$\lim_{x \to 0} \frac{\sin x}{x} = 1 \tag{2}$$

TEX 排版举例: 数学公式

矩阵

$$A = \begin{bmatrix} \frac{\partial^2 f}{\partial x_1^2} & \frac{\partial^2 f}{\partial x_1 \partial x_2} & \cdots & \frac{\partial^2 f}{\partial x_1 \partial x_n} \\ \frac{\partial^2 f}{\partial x_2 \partial x_1} & \frac{\partial^2 f}{\partial x_2^2} & \cdots & \frac{\partial^2 f}{\partial x_2 \partial x_n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial^2 f}{\partial x_n \partial x_1} & \frac{\partial^2 f}{\partial x_n \partial x_2} & \cdots & \frac{\partial^2 f}{\partial x_n^2} \end{bmatrix}$$

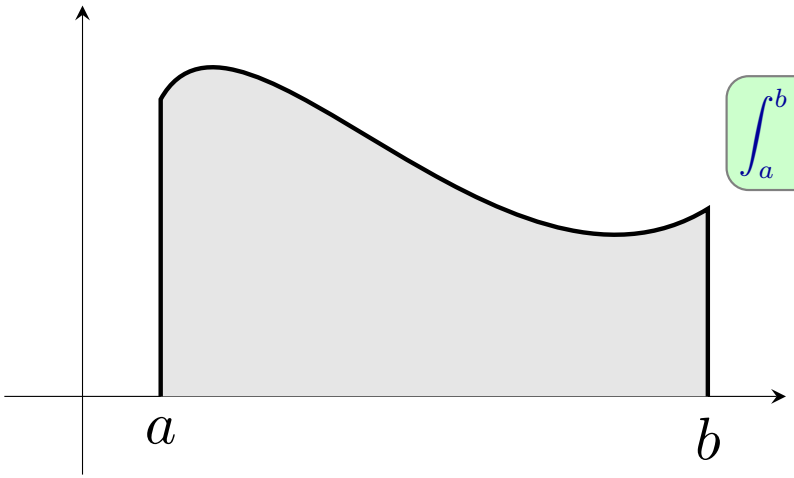
花体字

$$\mathbb{ABCDEFGHIJKLMNOPQRSTUVWXYZ}$$

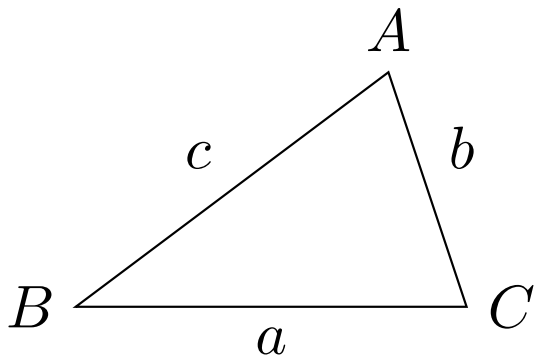
$$\mathcal{ABCDEFGHIJKLMNOPQRSTUVWXYZ}$$

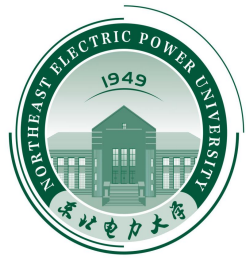
$$\mathscr{ABCDEFGHIJKLMNOPQRSTUVWXYZ}$$

TEX 排版举例: 图形排版



$$\int_a^b f(x)\,\mathrm{d}x = F(b) - F(a)$$





TEX 排版举例：文档

JOINT STRUCTURED GRAPH LEARNING AND UNSUPERVISED FEATURE SELECTION

Yong Peng, Leijie Zhang, Wanzeng Kong, Feiping Nie and Andrzej Cichocki
yongpeng@hdu.edu.cn

Abstract

The central task in graph-based unsupervised feature selection (GUFS) depends on two folds, one is to accurately characterize the geometrical structure of the original feature space with a graph and the other is to make the selected features well preserve such intrinsic structure. Currently, most of the existing GUFS methods use a two-stage strategy which constructs graph first and then perform feature selection on this fixed graph. Since the performance of feature selection severely depends on the quality of graph, the selection results will be unsatisfactory if the given graph is of low-quality. To this end, we propose a joint graph learning and unsupervised feature selection (JGUFS) model in which the graph can be adjusted to adapt the feature selection process. The JGUFS objective function is optimized by an efficient iterative algorithm whose convergence and complexity are analyzed in detail. Experimental results on representative benchmark data sets demonstrate the improved performance of JGUFS in comparison with state-of-the-art methods and therefore we conclude that it is promising of allowing the feature selection process to change the data graph.

Model Formulation

$$\min_{\mathbf{S},\mathbf{W},\mathbf{F}} \|\mathbf{S}-\mathbf{A}\|_F^2 + \alpha \mathbf{Tr}(\mathbf{F}^T\mathbf{L_s}\mathbf{F}) + \beta(\|(\mathbf{X}\mathbf{W}-\mathbf{F}\|_F^2 + \gamma\|\mathbf{W}\|_{2,1}) \quad (1)$$
$$s.t.\ \mathbf{S1}=\mathbf{1}, \mathbf{S}\geq\mathbf{0}, \mathbf{F}^T\mathbf{F}=\mathbf{I}_c, \mathbf{F}\geq\mathbf{0}$$

where $\mathbf{X}\in\mathbb{R}^{n\times d}$ is the data matrix, $\mathbf{W}\in\mathbb{R}^{d\times c}$ is the projection matrix, β and γ are regularization parameters. Similar to [1, 2], we impose the non-negativity on F here

Conclusion

In this paper, we proposed a novel GUFS method, termed JGUFS, which simultaneously performs graph construction and feature selection. Instead of performing feature selection on a fixed graph, JGUFS successfully avoided the disadvantages caused by the two-stage strategy. In JGUFS, the subobjectives respectively corresponding to graph construction and unsupervised feature selection could co-evolve towards the optimum. An efficient iterative optimization method with convergence guarantee was presented to optimize the JGUFS objective. Extensive experiments were conducted on representative data sets to demonstrate the excellent performance of JGUFS in comparison with state-of-the-art methods.

JGUFS	89.8±0.6	73.9±2.1	63.9±1.1	52.9±1.0	79.8±1.3	20.3±2.3	79.9±1.2

Optimization

With other two variables fixed, the following formula can be proved:

$$\mathcal{O}(\mathbf{F}^{t+1},\mathbf{W}^t\mathbf{S}^t) \leq \mathcal{O}(\mathbf{F}^t,\mathbf{W}^t\mathbf{S}^t),$$
$$\mathcal{O}(\mathbf{F}^{t+1},\mathbf{W}^{t+1}\mathbf{S}^t) \leq \mathcal{O}(\mathbf{F}^{t+1},\mathbf{W}^t\mathbf{S}^t)$$
$$\mathcal{O}(\mathbf{F}^{t+1},\mathbf{W}^{t+1}\mathbf{S}^{t+1}) \leq \mathcal{O}(\mathbf{F}^{t+1},\mathbf{W}^{t+1}\mathbf{S}^t)$$

We conclude that JGUFS objective function monotonically decreases under the optimization in Algorithm. 1.

Algorithm 1 Optimization to JGUFS objective function

Input: Data matrix $\mathbf{X}\in\mathbb{R}^{n\times d}$, λ, β, and γ, c, the dimension of projected subspace c;

Output: Rank features based on the values of $\|w_i\|_2|_{i=1}^d$ in descending order and then select the top-ranked ones.

1: Initialization. Construct the initial graph affinity matrix $\mathbf{A}$ based on the 'HeatKernel' function; Calculate $\mathbf{F}\in\mathbb{R}^{n\times c}$ by the c eigenvectors of the graph Laplacian $\mathbf{L_A} = \mathbf{D_A} - \frac{\mathbf{A}^T+\mathbf{A}}{2}$ corresponding to the c smallest eigenvalues; Initialize $\mathbf{M}\in\mathbb{R}^{d\times d}$ as an identity matrix;;

2: **while** not converged **do**

3: Update $\mathbf{S}$ by solving:

$$\min_{s_i\mathbf{1}=1, s_i\geq 0} \|s_i - (a_i - \frac{\alpha}{2}d_i)\|_F^2,$$

where, $d_{ij} = \|f_i - f_j\|_2^2$ and d_i as a vector with the j-th element equal to d_{ij}. Similarly, we get a_i and s_i.

4: Update $\mathbf{W}$ by:

$$\mathbf{W} = (\mathbf{X}^T\mathbf{X} + \gamma\mathbf{M})^{-1}\mathbf{X}^T\mathbf{F}$$

5: Update $\mathbf{M}$ by:

$$m_{ii} = \frac{1}{2\|w\|_2} = \frac{1}{2\sqrt{w_i w_i^T + \delta}}$$

6: Update $\mathbf{F}$ by:

$$d_{ij} \leftarrow \frac{(\lambda\mathbf{F})_{ij}}{\mathbf{RF} + \lambda\mathbf{F}\mathbf{F}^T\mathbf{F}}$$

7: **end while**

Analysis

Figure 1 illustrates the clustering performance of JGUFS on COIL20 with different settings of parameters. From this figure, we find that JGUFS provides excellent performance when the parameters are set as different values in a wide range. Further, we can observe that even if a small number of features are selected, JGUFS can still achieve relatively good clustering results.

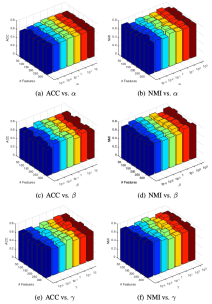

Figure 1: Performance of JGUFS algorithm for large variation of set of control parameters.

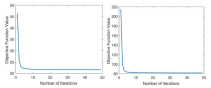

Figure 2: Convergence speed of JGUFS for UMIST and COIL20 data sets.

Figure 2 shows the convergence curves of the JGUFS objective function in terms of the number of iterations on UMIST and COIL20 from which we can observe that JGUFS has a relatively fast convergence speed.

宏包与环境

在使用 LaTeX 时，时常需要依赖一些扩展来增强或补充 LaTeX 的功能，比如排版复杂的表格、插入图片、增加颜色甚至超链接等等。这些扩展称为宏包。

```
\usepackage{package}
```

LaTeX 还引入了环境的用法，用以令一些效果在局部生效，或是生成特殊的文档元素。

```
\begin{<environment name>}{<arguments>}
. . .
\end{<environment name>}
```

   - \zihao{2} 电气工程学院 → 电气工程学院
   - \Large\textbf{我最帅} → **我最帅**
2. 环境
   - 无序列表环境 \begin{itemize} ... \end{itemize}
   - 有序列表环境 \begin{enumerate} ... \end{enumerate}

LaTeX 环境命令举例

```
\begin{itemize}
\item 第一
\item 第二
\item 第三
\end{itemize}
```

- 第一
- 第二
- 第三

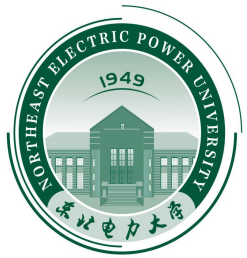
```
\begin{enumerate}
\item 绝对不意气用事
\item 绝对不漏判任何一件坏事
\item 绝对裁判的公正漂亮
\end{enumerate}
```

1. 绝对不意气用事
2. 绝对不漏判任何一件坏事
3. 绝对裁判的公正漂亮

LaTeX 环境命令举例

常用命令

\chapter 章	\section 节	\maketitle 生成标题页	\tableofcontents 生成目录
\newpage 新的一页	\makebox 生成盒子	\vskip 垂直距离	\caption 标题
\label 标号	\ref 引用图表公式等	\includegraphics 插入图片	\cite 引用参考文献



文章结构

```
\usepackage{ctex}
\tableofcontents % 生成目录
\chapter{有监督学习}
\section{分类}
\subsection{逻辑回归}
\section{回归}
\subsection{线性回归}
```

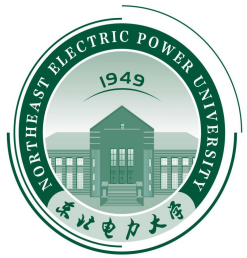
第一章　有监督学习

第一节　分类

§1.1.1　逻辑回归

第二节　回归

§1.2.1　线性回归



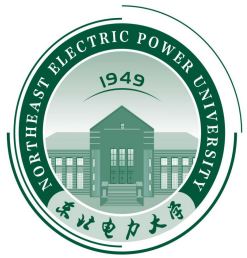
交叉引用和脚注

```
% 给对象命名：图片、表格、公式
\label{key}
% 引用对象
\ref{label}
\pageref{label}
```

从第 7 页的公式 1 中我们可以看出

```
\footnote{text}
```

这里有一个可爱的脚注[1]



[1] 我在这里

交叉引用和脚注

```
东电图标请参见图~\ref{fig:logo}
\begin{figure}[htbp]
\centering
\includegraphics[scale=0.08]%
{figure/neepu_logo}
\caption{东北电力大学图标}
\label{fig:logo}
\end{figure}
```

东电图标请参见图 1

东北电力大学
NORTHEAST ELECTRIC POWER UNIVERSITY

图 1: 东北电力大学图标

参考文献

LaTeX 提供了\cite 命令用于引用参考文献：

```
\cite{<citation>}
```

- 推荐使用 BibTeX 样式
  - 参考文献自动管理
  - bib 文件
  - bst 参考文献样式

如 “在许多文献[1, 2] 中”

```
@article{li2018two,
title={A two-stage approach for combined heat and power economic emission dispatch: Combining multi-objective optimization with integrated decision making},
author={Li, Yang and Wang, Jinlong and Zhao, Dongbo and Li, Guoqing and Chen, Chen},
journal={Energy},
volume={162},
pages={237–254},
year={2018},

publisher={Elsevier} }
```

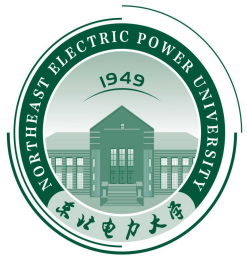
数学公式

数学公式排版是 LaTeX 的绝对强项，在 LaTeX 中排版数学公式需要进入数学模式

- 用两个 $ 美元符包围起来的是行内公式
- 用两个双美元符 $$ 包围起来的是行间公式
- 用 equation 环境包围的是带编号的公式
- 条件公式用 cases 环境，多行公式用 split、align、gather 环境等
- 运行 texdoc symbols 查看符号表



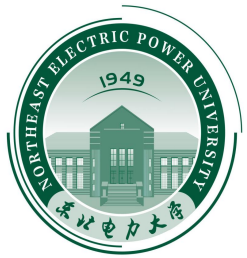
数学公式

```
在公式$V = \frac{4}{3}\pi r^2$中，有：
$$\lim_{n \rightarrow \infty}(1+\frac{1}{n})^n=e \quad
        V = \frac{4}{3}\pi r^2$$
这是一个极限n趋于无穷大的极限
```

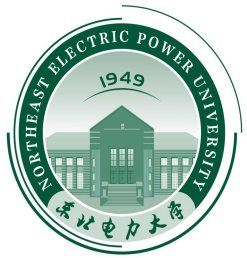
在公式 $V = \frac{4}{3}\pi r^2$ 中，有：

$$\lim_{n \rightarrow \infty}(1+\frac{1}{n})^n=e \quad V = \frac{4}{3}\pi r^2$$

这是一个极限 n 趋于无穷大的极限



目录



阅读材料

1. 略读包太雷《LaTeXNotes(第二版)》
2. 仔细阅读《一份不太简短的 LaTeX 2_ε 介绍》(lshort-zh)
3. 仔细阅读 CTeX 宏集手册
4. LaTeX 入门（刘海洋）
5. 根据所需宏包查阅宏包手册
6. texdoc 例如：texdoc lshort-zh

Introduction
There is a theory which states that if ever anyone discovers exactly what the Universe is for and why it is here, it will instantly disappear and be replaced by something even more bizarre and inexplicable.
There is another theory which states that this has already happened.

一点点经验分享

- LaTeX 是排版系统，不是文字处理器
- 所有文档都是过时的
- 请不要使用 CTeX 套装发行版，使用 CTEX 宏包
- 如果要输入中文
  - 请用 XeLaTeX，请用 XeLaTeX，请用 XeLaTeX。
  - UTF-8 编码，UTF-8 编码，UTF-8 编码。
- 写一点编译一次，提高容错
- 用好百度，Google
